

## §6.3 Subspaces

Def. 6.3.1 A subset  $W \subseteq V$  is a subspace of  $V$  which is itself a vector space, with the addition and scalar multiplication as in  $V$ .

Lem 6.3.2 / Prop 6.3.3: To check  $W$  is a subspace of  $V$ , it is enough to check ONE of the following equivalent things (you may use any in questions)

- c)  $W \ni \vec{0}$  and if  $\alpha, \beta \in W$  and  $a \in \mathbb{F}$ , then  $\alpha + \beta \in W$  and  $a\alpha \in W$   
*closed under addition* *closed under scalar multiplication*
- a)  $W \ni \vec{0}$  and if  $\alpha, \beta \in W$  and  $a, b \in \mathbb{F}$ , then  $a\alpha + b\beta \in W$
- b)  $W \ni \vec{0}$  and if  $\alpha, \beta \in W$  and  $a \in \mathbb{F}$ , then  $a(\alpha + \beta) \in W$  *mainly used in textbook/class*

Furthermore,  $W \ni \vec{0}$  in a, b, c above may be replaced by  $W \neq \emptyset$ .

Proof (outline):  
 $a \Rightarrow b$  - special case  $b=1$   
 $b \Rightarrow c$  - special case  $a=1$  or  $\beta = \vec{0}$   
 $c \Rightarrow a$  -  $\alpha \in W, \beta \in W \Rightarrow \alpha + \beta \in W$

$c \Rightarrow W$  is a vector space:

$c \Rightarrow$  axioms  $V1, V4, V6$

and other axioms don't mention  $W$

so they are true in  $W \because$  true in  $V$

$W \ni \vec{0} \Rightarrow W \neq \emptyset$ : clear

$W \neq \emptyset \Rightarrow W \ni \vec{0}$ : for  $\alpha \in W$ ,  
 $\vec{0} = 0\alpha \in W$ .

Ex: (most subspaces are defined  
 either by a form (explicit)  $\{ * \mid \text{no condition} \}$   
 or by a condition (implicit)  $\{ \alpha \in V \mid \dagger \}$   
 or a combination see §7.1

$$\textcircled{1} W = \left\{ \begin{pmatrix} a \\ 2a \\ 0 \\ b \end{pmatrix} \mid a, b \in \mathbb{R} \right\}$$

check  $W \stackrel{?}{=} \text{a subspace of } \mathbb{R}^4$ :  
 $\vec{0} \in W \because$  set  $a=0, b=0$ .

$$c \begin{pmatrix} a \\ 2a \\ 0 \\ b \end{pmatrix} + \begin{pmatrix} a' \\ 2a' \\ 0 \\ b' \end{pmatrix} = \begin{pmatrix} ca+a' \\ 2(ca+a') \\ 0 \\ cb+b' \end{pmatrix} \in W$$

② Let  $C^0(\mathbb{R}) = \{f: \mathbb{R} \rightarrow \mathbb{R} \text{ continuous}\}$   
 $C_{\text{even}}^0(\mathbb{R}) = \{f \in C^0(\mathbb{R}) \mid f(x) = f(-x) \forall x \in \mathbb{R}\}$

check this is subspace of  $C^0(\mathbb{R})$ :

$\vec{0} \in C_{\text{even}}^0(\mathbb{R}) \because \vec{0}(x) = 0 = \vec{0}(-x) \forall x.$

if  $f, g \in C_{\text{even}}^0(\mathbb{R})$ , then:

$$\begin{aligned} (af+g)(x) &= af(x) + g(x) \\ &= af(-x) + g(-x) \\ &= (af+g)(-x). \quad \forall x \in \mathbb{R} \end{aligned}$$

so  $af+g \in C_{\text{even}}^0(\mathbb{R})$ .

③  $P_{<n}(\mathbb{R})$  is a subspace of  $\mathbb{R}[x]$ ,  
and  $\mathbb{R}[x]$  is a subspace of  $C^0(\mathbb{R})$ .

Th 6.3.5 The intersection of any  
collection of subspaces is a  
subspace finitely or  
infinitely many

Ex:  $P_{\leq 3}(\mathbb{R}) \cap C_{\text{even}}^0(\mathbb{R})$   
 $= \{\text{even polynomials of degree } < 4\}$   
 $= \{a_0 + a_2 x^2 \mid a_0, a_2 \in \mathbb{R}\}$

Proof: Let  $\Lambda$  be some set, and for each  $\lambda \in \Lambda$ ,

let  $W_\lambda$  be a subspace of  $V$ .

Let  $W = \bigcap_{\lambda \in \Lambda} W_\lambda$  ( $= \{ \alpha \in V \mid \alpha \in W_\lambda \text{ for each } \lambda \in \Lambda \}$ )

$\vec{0} \in W \because \vec{0} \in W_\lambda$  for each  $\lambda$   
 $\because$  each  $W_\lambda$  is a subspace.

if  $\alpha, \beta \in W$ , then  $\alpha, \beta \in W_\lambda$  for each  $\lambda$   
 $a\alpha + \beta \in W_\lambda$  for each  $\lambda$ ,

$\because W_\lambda$  is a subspace.

$\therefore a\alpha + \beta \in W$ .

Remark: The union of two subspaces is NOT a subspace — see §6.5.

We can use 6.3.5 to make a subspace from a set.

Def 6.3.6: Given a set  $S \subseteq V$ , the span of  $S$ , written  $\text{span}(S)$ , is the intersection of all subspaces containing  $S$ .

Equivalently (Rem 6.3.8):

$\text{span}(S)$  is the subspace with this property: if any subspace  $W \supseteq S$ , then  $W \supseteq \text{span}(S)$ .

(Reason:  $\text{span}(S) = W \cap \bigcap$  all other subspaces containing  $S$ )

i.e.  $\text{Span}(S)$  is the "smallest subspace containing  $S$ ".

Equivalently (Th. 6.3.9)

$$\text{span}(S) = \left\{ \sum_{i=1}^n a_i \alpha_i \mid \begin{array}{l} \alpha_i \in S \\ a_i \in \mathbb{F} \end{array}, \text{ some } n \in \mathbb{N} \right\}$$

= "all linear combinations of finitely many elements from  $S$ "
